Soil Fertilizer - 13

The carbon dioxide content of the soil air in deep chernozem soils. V. B. Matsevich. *Trudy Pochvennogo Inst. im. V. V. Dokuchaeva, Akad. Nauk S.S.R.* 31, 214-38 (1950). CO₂ measurements were made on 4 plots: a soil steppe deep chernozem, a fallow steppe deep chernozem, a forest steppe chernozem in a forest adjoining the soil chernozem, and an open space in the same forest. Samples of soil air were taken every 10 days during the spring-summer months and every 1.5-2 months during the fall-winter months. Eight depths were sampled: at 25, 50, 75, 100, 125, 150, 200, and 300 cm. The brass sampling tubes are 6 mm. inside diam., with the bottom 5 cm. being perforated with holes 1 mm. in diam. This length of the tube was protected by a glass tube, the top being plugged with glass wool. A Hg pump was used to get the air out. The tubes used and the rest of the app. are clearly illustrated. The lowest concn. of CO₂ occurs during the early spring (around April, after the thawing of snow). The highest concn. occurs at the end of the summer, in September. The CO₂ forms in the org. matter layer during the growing season and it diffuses upward, above the soil, and downward. During the winter the CO₂ concn. of the soil air diminishes, but is always higher than in the overlying air. The lowering in CO₂ concn. begins at the surface layers, with the lower layer diffusing the CO₂ much slower. At a high moisture content there is a lowering of the gas exchange between the air within and above the soil. The highest concn. of CO₂ was found in the forest-steppe soil (0.4-1.88%), followed by the open spot in that area (0.18-1.72%), and still less in the soil chernozem (0.10-1.24%). Full data are presented in tabular and graphic forms. J. S. Joffe

AUTHOR: Matskevich V D., Postnov, V A

TITLE: A Standardized Approach to the Analysis of Local Welding Deformations on the Hull of a Ship (Normirovaniye mestnykh svarochnykh deformatsiy korpusa sudna)

PERIODICAL: Tr. Tsentr. n-i in-ta rech flota, 1955 Nr 31 pp 50-86

ABSTRACT: It is assumed that for small deformations from a plane the flexural deflection w_0 can be expressed by the equation $w_0 = B \ell^2$ in terms of the distance ℓ between rigid structural elements where B is a constant quantity dependent on the fabrication technique. Tables have been composed for values of B from a large number of shop observations. Calculations are given for the deformations that are to be expected, namely, the flexures and the contractions within the plane of the rib assembly resulting from the shrinkage of the welding seams, the angular deformations resulting from the nonuniform distribution of the plastic deformations throughout the thickness of the sheets, and the buckling due to loss of stability of the sheets during their welding onto the assembly. It is assumed that the

Card 1/2

124-57-1-1130

A Standardized Approach to the Analysis of Local Welding (cont.)

shrinkage deformations evoke internal stresses within the region of the welding seam that may be examined as external tangential stresses, so far as their effect on the external plating is concerned:

$$\tau_1 \sin 2\pi y/b \quad \text{for } x = \pm a/2$$

$$\tau_2 \sin 2\pi x/a \quad \text{for } y = \pm b/2$$

where a and b are the dimensions of a plate element. The flexural deflection is then found as $w = w_0 \cos \pi x/a \cos \pi y/b$. The nonlinear equation of the compatibility of the deformations is integrated exactly, wherein the boundary conditions are satisfied by the assumption that the plate element is freely supported along the full length of its four edges and that the edges remain straight and within the plane of the plate element. The equation of equilibrium is integrated by Bubnov's method and the relationship of w_0 versus the magnitude of the contraction between the transverse and longitudinal edges is thereby determined. The effect of the local deformation on the overall strength of the ship hull is examined in accordance with well-known methods [Papkovich, P. F., Stroitel'naya mekhanika korabliya, Ch. II (The Structural Mechanics of the Ship, Part II), Sudpromgiz, 1941].

Graphs and tables indicate the maximum permissible magnitudes of the local deformations for some types of naval structures. Kh. M. Mushtari

TITLE: The Scientific and Engineering Activity of Viktor Petrovich Vologdin and His Part in the Development of Welding in the Domestic Shipbuilding Industry (Nauchnaya i inzhenernaya deyatel'nost' Viktora Petrovicha Vologdina i yego rol' v razvitiu svarki v otechestvennom sudostroyenii)

PERIODICAL: Tr. Leningr. korablestroit. in-ta, 1956, Nr 19, pp 5-15

ABSTRACT: A presentation of short biographical data, as well as a description of Vologdin's work in the field of welding, beginning with 1923, when upon his initiative a welding shop was introduced at the Dal'zavod plant. In domestic shipbuilding for inland and marine navigation the name of Vologdin is associated with the conversion of vessels from riveted to welded construction. Vologdin always combined his scientific and teaching activities with his industrial work. Since 1933 Vologdin has headed the welding group of the Glavmorprom in Leningrad. During the ensuing years he worked out the technical specifications for steel in welded products.

Card 1/2

The Scientific and Engineering Activity of VIKTORI (cont.)

devised a standard for welded connections and seams, evolved an extensive classification of spoilage in welded connections, compiled technical specifications for oxygen in gas-welding of metal, and studied the problem of low-alloy steel welding and the application of welding to naval shipbuilding. Vologdin's monograph, embracing a tremendous wealth of experience in the field of welding, was published in 1945.

TITLE: An Investigation of Deformations in Welded T-beams Due to Longitudinal Seams (Issledovaniye deformatsiy svarnykh tavrovych balok ot prodol'nykh shvov)

PERIODICAL: Tr. Leningr. korablestroit. in-ta, 1956, Nr 19, pp 61-70

ABSTRACT: General and local deformations (D) may be observed in welded ship structures. The use of simplified stress-analysis equations is quite handy for determination of longitudinal weld D by calculation as contrasted with the usual methods involving the strength of materials and the theory of elasticity. For beams (B) with a high length-to-height ratio, equations are suggested for determining the longitudinal shortening of a plate (P) along a line passing through the center of gravity of the element or for any fiber parallel to this line, as are equations for the curvature and bending of the P . These equations are valid for P , B , bridge spans in which the length is 4 or 5 times as great as the height, etc. An investigation is made of the effect upon the degree of D of the method of assembling welded elements (on rigid or sliding tack

Card 1/2

137-58-5-9725

An Investigation of Deformations (cont.)

welds, positioning by cramp frames at one or two points, etc.) and the succession in which segments of a seam are made longitudinally. The investigation was conducted on T-beams of the following dimensions: cross section of web 150x6 mm, flange 30x6 and 90x6 mm, and 1200 mm length of web. The flange was welded for a length of 900 mm along its central portion. SKhL-1 steel was used for the B. Welding was done by hand and was in the form of a one-sided corner fillet weld by 4-mm diameter electrodes with OMM-5 coating, and the weld was by straight polarity D-C. The welding schedule called for 120 amps, 22 volts and a speed of 0.2 cm/sec. Good agreement was found between the calculations and real measurements of longitudinal shortening of the P and bending of built-up T-beams for the case of rigid holding of the flange against the web by tacking. In the welding of a free B - as compared to that of one assembled by tacking (where the flange is lashed to the web), the D were greater. The smallest D resulted in alternating welding from the center to the tips.

AUTHOR: Matskevich, V.D., Chairman

SOV/135-39-4-1872

TITLE: Fixing Terminology on Welding

PERIODICAL: Svarochnoye proizvodstvo, 1959, Nr 8, pp 42-43 (USSR)

ABSTRACT: In connection with the broad development of welding engineering the regulation of the terminology, which exists in this field, is becoming of high practical importance. This getting the more urgent the more welding is used and introduced in the different branches of technics. A peculiarity of welding engineering is the variety of problems and questions which belong to it. The two publications of national standards, which exist so far and deal with the technology on welding, GOST 2601-44, published in 1944, and a supplemented second edition of this standard issued in 1953, can both not be considered satisfactory. In these standards the terms are not classified, there is an abundance of regulations which makes the standards unclear, the ambiguity of the terms makes it necessary to introduce synonyms for a number of terms and many terms

Card 1/2

Fixing Terminology on Welding

JCV/131-1927-1-4

are chosen arbitrarily and are outdated and obsolete, or no longer corresponding to what they describe, it is therefore very essential to revise and supplement the national standard using the achievements of welding engineering at home and abroad. The author then considers several deficiencies in detail and proposes improvements.

The problem of the classification and the conditions of fissure formation in welded constructions.

Author(s): M. Okerblom, V. D.
Source: Nauchno-tekhnicheskii zhurnal "Metallichika", no. 4, 1963, 56; abstract 47477
(Tr. Izmerit. Korabliostroit. i D.-ta, vyp. 36, 1963, 19-27)

In the article proposed a breakdown of fissures by three groups - hot, warm and cold. The delineation of an independent group of warm fissures is based upon the possibility of distinguishing fissures which arise under conditions when the heat generated during the welding process has not been dissipated from the fissures after the following complete cooling of the tool (cold fissures) or from the fissures reaching the temperatures associated with the metal's biphasal hard-liquid condition (hot fissures). On the basis of a study of the force, geometrical and metallurgical criteria of the formation of cold fissures, the author establishes that the possibility of their formation is excluded completely in the case of the use of high-quality materials and modern welding technology is out of the question. N. O. Okerblom.

TITLE: Some Laws of the Process of Graphite Dispersion in an Aqueous Medium (Nekotoryye zakonomernosti protsesse razmel'eniya grafita v vodnoy srede)

PERIODICAL: Kolloidnyy zhurnal, 1958, Vol XX, Nr 5, pp 665-671 (USSR)

ABSTRACT: Graphite changes its properties (adsorption capacity, electric conductivity, granulometric composition, etc) according to the medium in which it is being dispersed. The laws for the dispersion of graphite in an aqueous medium by vibration mills are here studied, according to the speed of destruction and the speed of increase of specific surface. The granulometric composition of graphite after dispersion in an aqueous sulfite alkali solution is shown in Figure 2. There are three principal fractions of particles: fraction I with a particle diameter greater than 15 μ ; fraction II with diameters between 15 and 3 μ , fraction III with diameters below 3 μ . Figure 3 shows the quantitative relations of the three fractions during experiment. After 5 hours the content of fraction II is 80%. The dependence of the constants of destruction speed on the diameter of the graphite granules is shown in Figure 5. In the experiments, the initial speed for the growth of the specific sur-

Card 1/2

SCOV-69-20-5-20/23
Some Laws of the Process of Graphite Dispersion in an Aqueous Medium

face is equal to $1.8 \text{ m}^2/\text{g}$ per hour. For comparing the granulometric composition of the graphite, the specific volume of pressed powders has been measured. The pressed volume of briquets made of dry graphites is always smaller than those made of graphites dispersed in water. During dispersion of dry graphite, the speed of growth of a specific surface increases sharply and the secondary structure and the granulometric composition of the graphite change. There are 8 sets of graphs, 2 tables, and 10 references, 8 of which are Soviet and 2 German.

TITLE: Automatic machine for packaging liquid products in cans with inserted or
rolled lids. Class 61, No. 173867

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 20, 1965, 140

TOPIC TAGS: automation, storage device, lubricant

ABSTRACT: This Author Certificate presents an automatic machine for packaging liquid products in cans with inserted or rolled lids (for example, oils and lubricants), consisting of mechanisms for transporting and transferring cans, metering and filling of cans, interlocking and automation of the operations. To improve production, decrease working area, and eliminate individual drives for each automated transporting or synchronizing device, the machine is constructed as a single unit (see Fig. 1) with provisions for rolling or inserting lids from a lid bin, a labeling device with label magazine, and a common automated drive.

TOPIC TAGS: refrigeration engineering, refrigeration equipment, cryogenic fluid compressor, industrial management, electric relay

ABSTRACT: On the basis of recent experience in the installation and operation of automated refrigeration units for the food industry, many new design decisions have been made. These include pulse control systems, in which a status-determining pulse is supplied to the temperature relay system each thirty minutes, the position of the relays determining whether an additional compressor is started, one or more compressors are stopped, or the system is allowed to run as before for an additional 30 minutes; new ammonia supply, ball-bearing protection and compressor protection equipment for automation of compressor units; new centralized compressor control panels, located near compressor installations and equipped with signal lights to indicate the reasons for automatic stoppages of equipment; remote control units for non-compressor equipment; location of control rooms adjacent to compressor installations; standards for reduction of the number of service personnel present for operation as experience in operating installations is gained. Orig. art. has 2 figures.

Mackinaj, R. Yu. A universal continuous mapping of Hilbert spaces. Izvestiya Akad. Nauk SSSR. Ser. Mat. 15, 533-544 (1951). (Russian)

Let H and H' be separable Hilbert spaces. There exists a continuous mapping of H into H' such that for every analytic subset B of H' and every open subset G of H , there exists a closed subset A of G such that $f(A)$ is homeomorphic to B .
